

Consumer Confidence Report – 2018 Covering Calendar Year – 2017

This brochure is a snapshot of the quality of the water that we provided last year. Included are the details about where your water comes from, what it contains, and how it compares to Environmental Protection Agency (EPA) and state standards. We are committed to providing you with information because informed customers are our best allies. **To learn more about your drinking water, please attend any of the regularly scheduled meetings, which are held the 2nd & 4th Monday of each month at 7:30 P.M. at City Hall.** For more information, please contact, RICK SAILLER at 913-667-3514.

Bonner Springs sources of drinking water

Our drinking water comes from 5 Ground Water Wells located in an alluvial aquifer 75-80 feet deep, just north of the Kansas River. The well water is filtered naturally within this aquifer then is chemically treated and filtered again at the Bonner Springs Utilities (BSU) Water Treatment Plant. The water is treated to remove contaminants such as iron and manganese and a disinfectant (chlorine) is added to protect you against microbial contaminants. Some of our drinking water is supplied from Kansas City Board of Public Utilities (BPU) through a Consecutive Connection (CC). The water we purchase from BPU is drawn from the Missouri River watershed. This water is collected and filtered through horizontal collector wells in an aquifer located below the Missouri River. BPU filters and treats this water similar to Bonner Springs including the disinfection process. BSU and BPU perform multiple daily tests of the treated water to ensure that your water is safe to drink. To find out more about your drinking water sources and the chemicals used to treat the water, please contact our office at 913-422-8117.

Is my Water Safe to Drink?

Absolutely! Your water is treated to remove several contaminants and a disinfectant is added to protect you against microbial contaminants. The Safe Drinking Water Act (SDWA) required states to develop a Source Water Assessment (SWA) for each public water supply that treats and distributes raw source water in order to identify potential contamination sources. The state has completed an assessment of our source water.

The sources of drinking water (both tap water and bottled water) included rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as those with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

Contaminants that may be present in sources water before we treat it include: Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, livestock operations and wildlife. Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming. Pesticides and herbicides, which may come from a variety of sources such as storm water run-off, agriculture, and residential users. Radioactive contaminants, which can be naturally occurring or the result of mining activity. Organic contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and also come from gas stations, urban storm water run-off, and septic systems.

In order to ensure that tap water is safe to drink, EPA prescribes regulation which limits the amount of certain contaminants in water provided by public water systems. We treat our water according to EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Our water system is required to test a minimum of 9 samples per month in accordance with the Total Coliform Rule for microbiological contaminants. Coliform bacteria are usually harmless, but their presence in water can be an indication of disease-causing bacteria. When coliform bacteria are found, special follow-up tests are done to determine if harmful bacteria are present in the water supply. If this limit is exceeded, the water supplier must notify the public.

WATER QUALITY IS MONITORED CONTINUOUSLY – 24/7

We use several on-line analyzers to monitor water quality 24 hours-a-day, 7 days a week. The analyzer data is monitored by our computer control system which alerts our operators if the data is outside of a desired range. Our system will even shut down treatment operations if the data is extremely different than our allowable range. We monitor pH, chlorine and turbidity (clarity).

Water Quality Data

The following tables list all of the drinking water contaminants which were detected during the 2017 calendar year. The presence of these contaminants does not necessarily indicate the water poses a health risk. Unless noted, the data presented in this table is from the testing done January 1- December 31, 2017. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, is more than one year old.

The bottom line is that the water that is provided to you is safe.

Terms & Abbreviations

Maximum Contaminant Level Goal (MCLG): the "Goal" is the level of a contaminant in drinking water below which there is no known or expected risk to human health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL): the "Maximum Allowed" MCL is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Secondary Maximum Contaminant Level (SMCL): recommended level for a contaminant that is not regulated and has no MCL.

Action Level (AL): the concentration of a contaminant that, if exceeded, triggers treatment or other requirements.

Treatment Technique (TT): a required process intended to reduce levels of a contaminant in drinking water.

Maximum Residual Disinfectant Level (MRDL): the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Non-Detects (ND): lab analysis indicates that the contaminant is not present.

Parts per Million (ppm) or milligrams per liter (mg/l)

Parts per Billion (ppb) or micrograms per liter ($\mu\text{g/l}$)

Picocuries per Liter (pCi/L): a measure of the radioactivity in water.

Millirems per Year (mrem/yr): measure of radiation absorbed by the body.

Monitoring Period Average (MPA): An average of sample results obtained during a defined time frame, common examples of monitoring periods are monthly, quarterly and yearly.

Nephelometric Turbidity Unit (NTU): a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person. Turbidity is not regulated for groundwater systems.

Running Annual Average (RAA): an average of sample results obtained over the most current 12 months and used to determine compliance with MCLs.

Locational Running Annual Average (LRAA): Average of sample analytical results for samples taken at a particular monitoring location during the previous four calendar quarters

Testing Results for: CITY OF BONNER SPRINGS

Regulated Contaminants	Collection Date	Highest Value	Range (low/high)	Unit	MCL	MCLG	Typical Source
ARSENIC	1/11/2017	1.9	1.9	ppb	10	0	Erosion of natural deposits
ATRAZINE	6/14/2017	0.36	0.36	ppb	3	3	Runoff from herbicide used on row crops
BARIUM	1/11/2017	0.15	0.15	ppm	2	2	Discharge from metal refineries
CHROMIUM	1/11/2017	2.3	2.3	ppb	100	100	Discharge from steel and pulp mills
FLUORIDE	1/11/2017	0.49	0.22 - 0.49	ppm	4	4	Natural deposits; Water additive which promotes strong teeth.
NITRATE	2/8/2017	0.46	0.41 - 0.46	ppm	10	10	Runoff from fertilizer use
SELENIUM	1/11/2017	2.8	2.8	ppb	50	50	Erosion of natural deposits

Disinfection Byproducts	Monitoring Period	Highest RAA	Range (low/high)	Unit	MCL	MCLG	Typical Source
TOTAL HALOACETIC ACIDS (HAA5)	2016	21	9.2 - 21	ppb	60	0	By-product of drinking water disinfection
TTHM	2016	45	21 - 45	ppb	80	0	By-product of drinking water chlorination

Lead and Copper	Monitoring Period	90 th Percentile	Range (low/high)	Unit	AL	Sites Over AL	Typical Source
COPPER, FREE	2015 - 2017	1.6	0.023 - 1.8	ppm	1.3	5	Corrosion of household plumbing
LEAD	2015 - 2017	3.9	1.1 - 7.5	ppb	15	0	Corrosion of household plumbing

Additional Required Health Effects Language:

Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Your water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

During the 2017 calendar year, we had the below noted violation(s) of drinking water regulations.

Compliance Period	Analyte	Comments
1/1/2017 - 12/31/2017	CDS_DBP_TOTALS	MONITORING, ROUTINE (DBP), MAJOR
4/1/2017 - 6/30/2017	CDS FOR FLUORIDE	STATE MONITORING

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER
Monitoring Requirements Not Met for CITY OF BONNER SPRINGS

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During Year of 2017 we did not properly monitor for the disinfection by-products of Haloacetic Acids (HAA) and Total Trihalomethanes (TTHM) as required by Kansas Administrative Regulations. **Even though this was not an emergency, as our customers you have a right to know what happened and what we did to correct the situation.**

How did the violation occur?

We submitted our samples later than required in August 2017. The KDHE regulations are strict and since we submitted later than the required, a violation was issued. The 2017 sampling results are listed below:

Disinfection Byproducts	Monitoring Period	Highest RAA	Range (low/high)	Unit	MCL	MCLG	Typical Source
TOTAL HALOACETIC ACIDS (HAA5)	2017	16	9.2 - 21	ppb	60	0	By-product of drinking water disinfection
TTHM	2017	28	21 - 45	ppb	80	0	By-product of drinking water chlorination

What should I do? (Do not panic)

You do not need to use an alternative (e.g., bottled) water supply. However, if you have specific health concerns, consult your doctor.

What does this mean?

This is not an immediate risk. If it had been, you would have been notified immediately. However, some people who drink water containing trihalomethanes and/or haloacetic acids in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous systems, and may have an increased risk of getting cancer.

What are we doing to ensure compliance?

We reviewed procedures for sampling and submitting the samples for testing to ensure we meet the requirement of the monitoring regulation. Since the sampling was completed, the test results indicate that our water is below MCL.

What is I have additional questions or concerns?

If you have any further questions or concerns, please contact Rick Sailer, Public Works Director; 913-667-3514 or by Mail: 205 E 2ND ST, PO BOX 38, BONNER SPRINGS, KS 66012-1914

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

This notice is being sent to you by CITY OF BONNER SPRINGS

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER
Monitoring Requirements Not Met for CITY OF BONNER SPRINGS Water system

Our water system failed to collect a fluoride monitoring sample on time during the Second Quarter of 2017. **Even though this was not an emergency, as our customers, you have a right to know what happened and what we did to correct the situation.**

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During Second Quarter of 2017 we were supposed to collect a sample for fluoride. Because we did not collect the sample, we cannot be sure of the fluoride levels during the Second Quarter of 2017 time frame. The maximum contaminant level (MCL) for fluoride in drinking water is 4.0 mg/L as a running annual average.

What should I do?

There is nothing you need to do at this time. You do not have to use an alternate water supply.

What does this mean?

This is not an immediate risk. If it had been, you would have been notified immediately. *However, some people who drink water containing fluoride in excess of the MCL over many years could get bone disease, including pain and tenderness of the bones. Fluoride in drinking water at half the MCL or more may cause mottling of children's teeth, usually in children less than nine years old. Mottling, also known as dental fluorosis, may include brown staining and/or pitting of the teeth, and occurs only in developing teeth before they erupt from the gums.*

FLUORIDE	1/11/2017	0.49	0.22 0.49	-	ppm	4	4	Natural deposits; Water additive which promotes strong teeth.
	7/12/2017	0.47						
	9/27/2017	0.22						

(Sampling data for 2017 is listed above. The missed sample happened in the second quarter of 2017. Our fluoride results never exceed 1.0ppm)

What are we doing to ensure compliance?

We reviewed procedures for sampling and submitting the samples for testing to ensure we meet the requirement of the monitoring regulation. Since the sampling was completed, the test results indicate that our water is below MCL.

What if I have additional questions or concerns?

If you have any further questions or concerns, please contact Rick Sailer, Public Works Director; 913-667-3514 or by Mail: 205 E 2ND ST, PO BOX 38, BONNER SPRINGS, KS 66012-1914

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.
